

# Angular 2

## Module 3 - Services

Peter Kassenaar –  
[info@kassenaar.com](mailto:info@kassenaar.com)

# Services

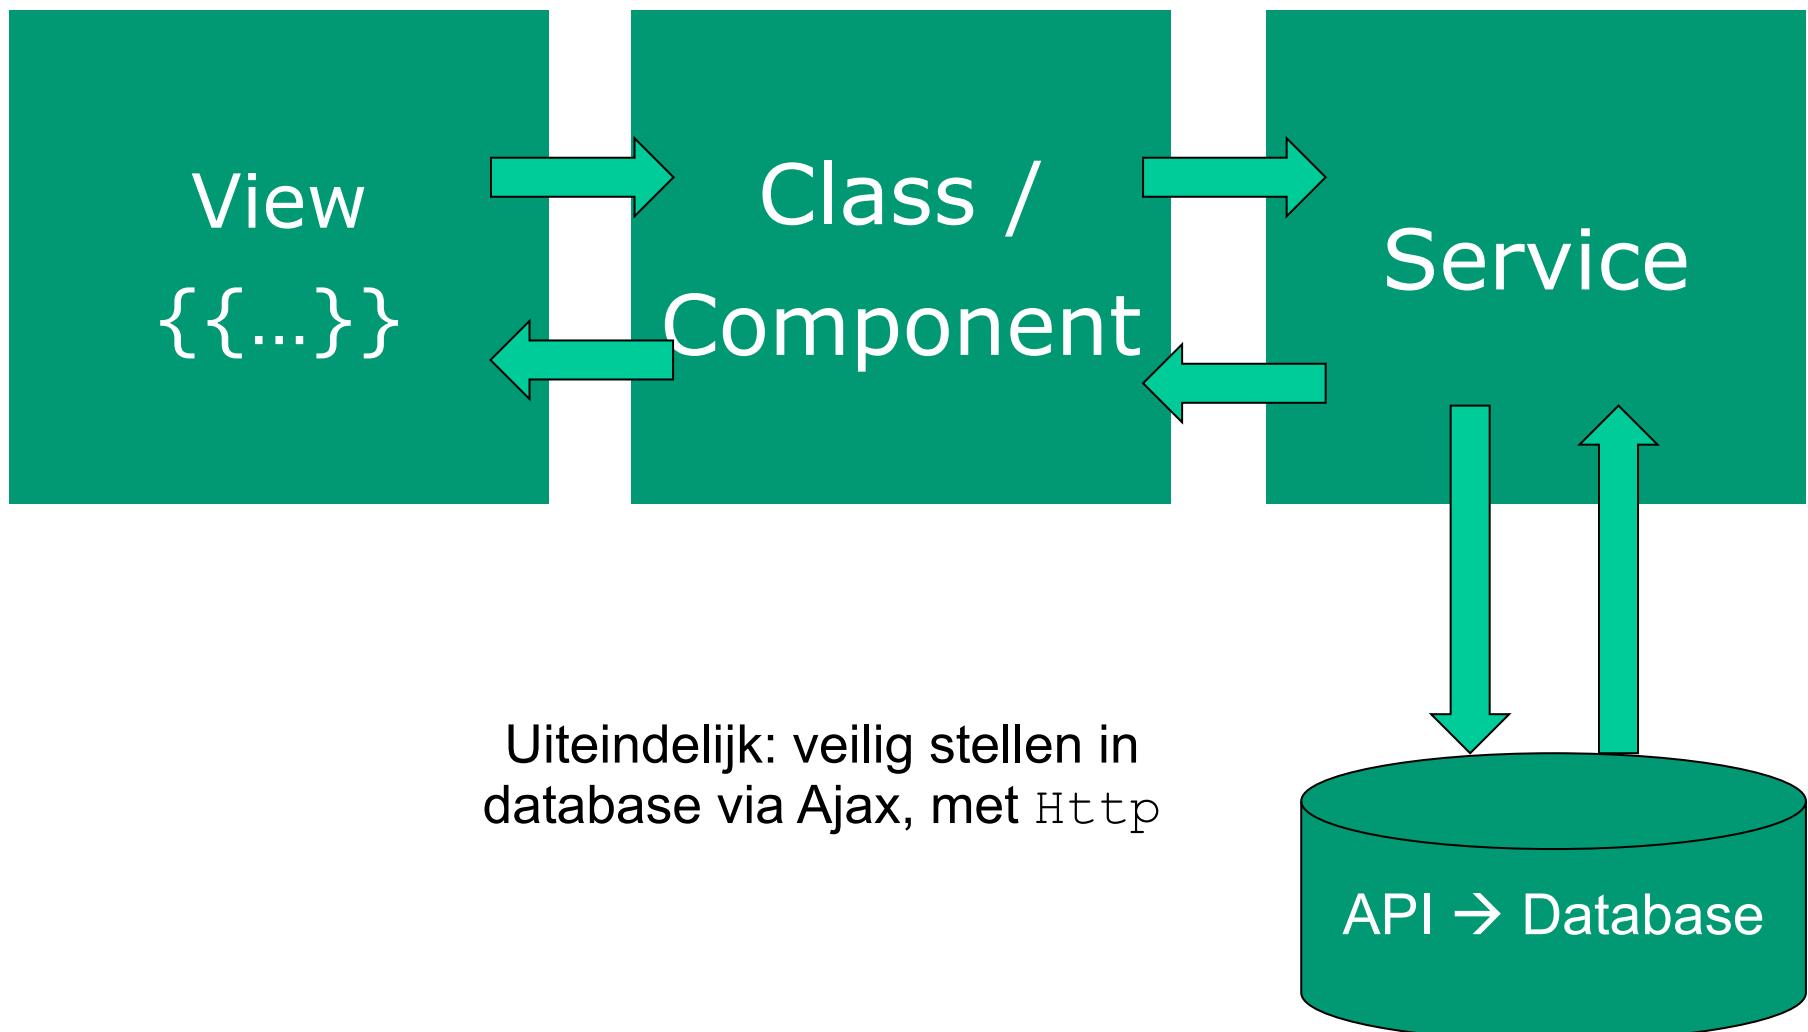

Doel – datafunctionality herbruikbaar maken voor verschillende componenten

- Data retrieval
  - Data caching
  - Data Storage,
  - ...
- 
- Angular 2 : één optie
    - `export class myDataService { ... }`

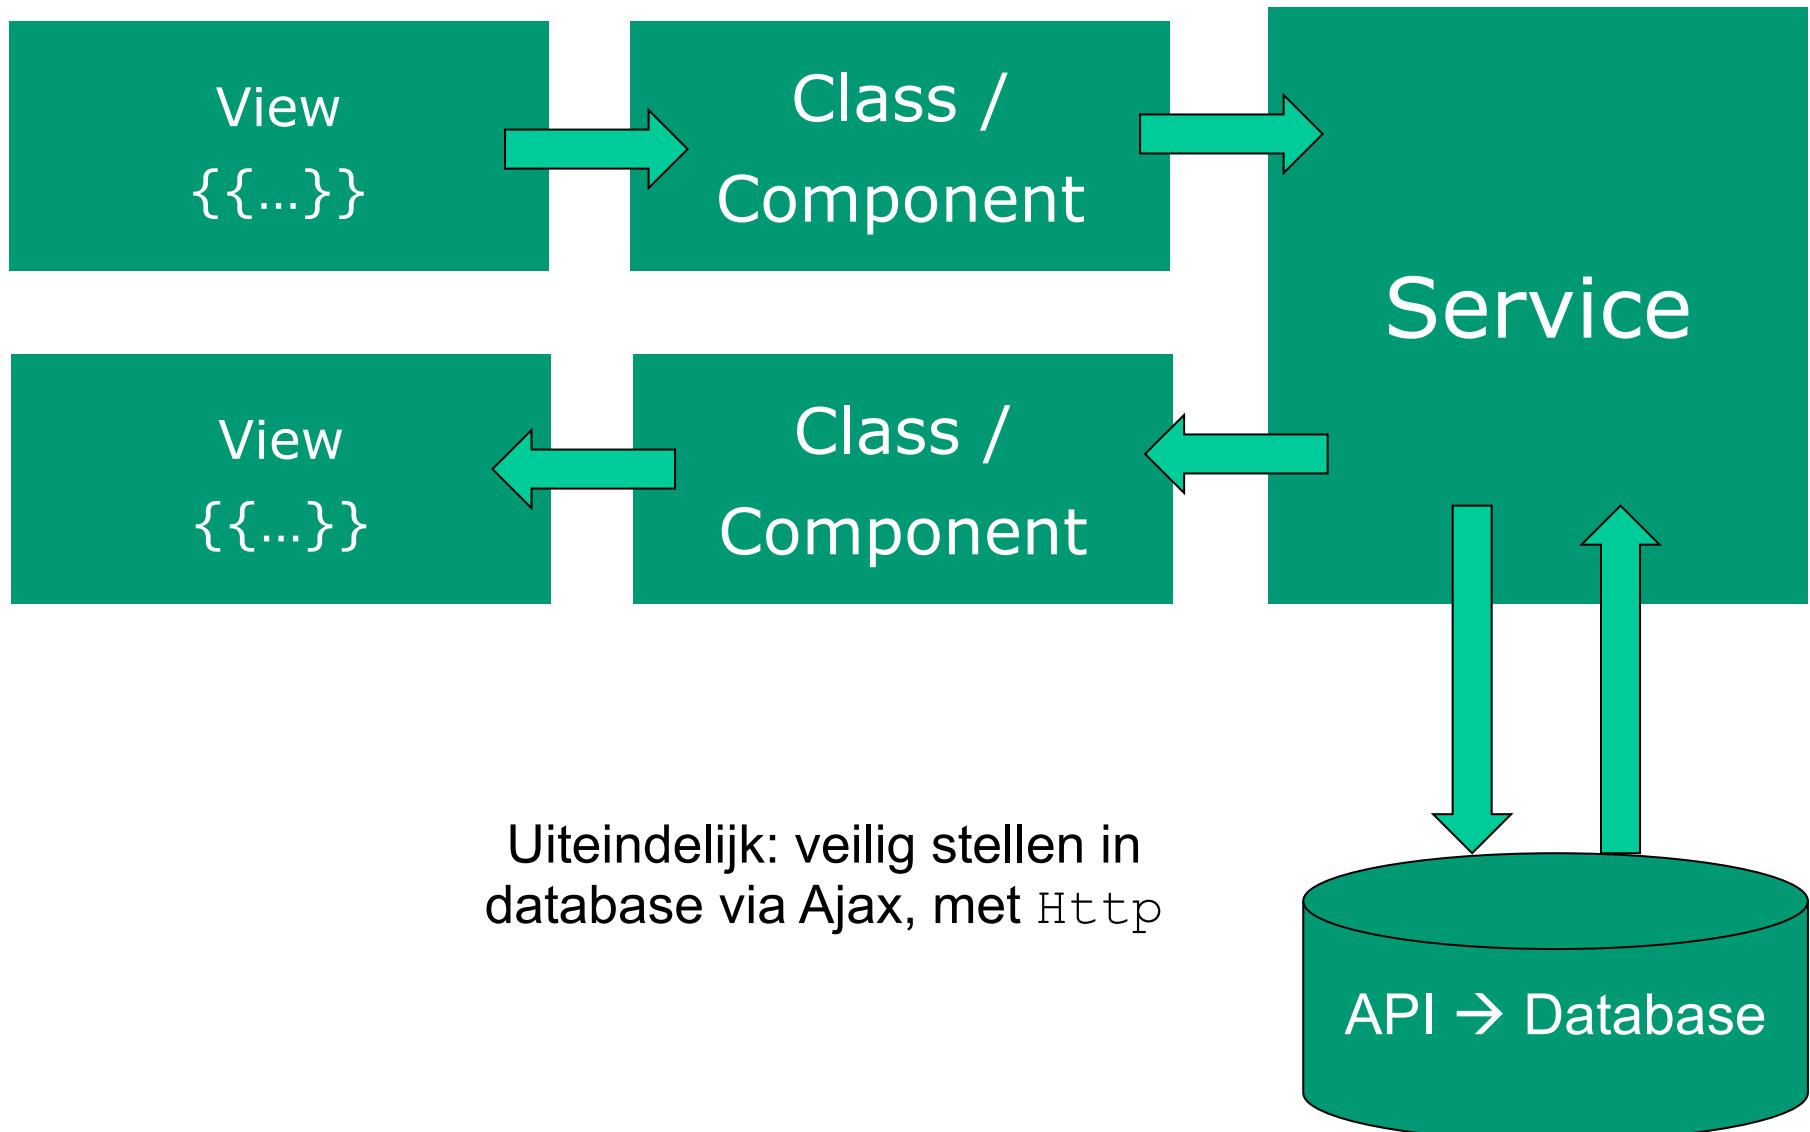

# Singleton?

- Services zijn (in principe) singletons
  - Maar: afhankelijk van de plek waar ze geïnstantieerd worden!
  - Ze zijn een singleton voor de component en alle child components.
  - Module/Site-wide gebruiken? Instantieer service in app.module.ts

# Data flow

# Data flow

# Services in Angular 2

Data services in Angular 1:

```
angular.module('myApp')  
  .service(...)  
  .factory(...)  
  .provider(...)
```

Data services in Angular 2:

```
import {Injectable} from 'angular2/core';  
  
@Injectable()  
export class CityService{  
  //....  
}
```

# De rol van `@Injectable`

Why? – Dependency Injection (DI) en metadata!

*"TypeScript sees the `@Injectable()` decorator and emits metadata about our service, metadata that Angular may need to inject other dependencies into this service."*

<https://angular.io/docs/ts/latest/tutorial/toh-pt4.html>

*"Our service doesn't have any dependencies at the moment. Add the decorator anyway.*

*It is a best practice to apply the `@Injectable()` decorator **from the start** both for consistency and for future-proofing"*

# Stap 1 – service maken (static data)

```
import { Injectable } from '@angular/core';
import { City } from './city.model'

@Injectable()
export class CityService {
  cities:City[] = [
    new City(1, 'Groningen', 'Groningen'),
    ...
  ];

  // retourneer alle cities
  getCities() {
    return this.cities
  }

  // retourneer city op basis van ID
  getCity(id:number) {
    return this.cities.find(c => c.id === id);
  }
}
```

# Stap 2 – Service consumeren/injecten

```
...
import {CityService} from "./city.service";

@Component({
  selector  : 'hello-world',
  templateUrl: 'app/app.html',
})

export class AppComponent implements OnInit {
  // Properties voor de component/class
  currentCity: City;
  cities: City[];
  cityPhoto: string;

  constructor(private cityService: CityService) {

  }

  ngOnInit() {
    this.cities = this.cityService.getCities();
  }

  getCity(city: City) {
    this.currentCity = this.cityService.getCity(city.id);
    this.cityPhoto  = `img/${this.currentCity.name}.jpg`;
    console.log('City opgehaald:', this.currentCity);
  }
}
```

**local variables**

**Constructor: shorthand voor nieuwe private variable + instantiering!**

**Detailgegevens voor city bij (click) event**

# “No provider for CityService”

- Solution: inject in app.module.ts

```
Console
✖ top ▾ Preserve log
✖ ► EXCEPTION: Error in ./AppComponent class AppComponent_Host - inline template:0:0 caused by: No provider for CityService! core.umd.js:3462

```

# Service injecteren in Module

- Alleen de *referentie* naar CityService is niet voldoende.
- Angular moet de service *injecteren* in de module
- Gebruik de annotatie providers: [ ... ]

```
// Module declaration
@NgModule({
  imports      : [ BrowserModule ],
  declarations: [ AppComponent ],
  bootstrap    : [ AppComponent ],
  providers    : [ CityService ] // DI voor service
})
export class AppModule {
```

Array met  
Service-  
dependencies

# Checkpoint

- Elke service in Angular 2 is een class
- Class importeren in de component die hem gebruikt
- Instantiëren in constructor()
- Service invoegen in de Module
- Oefening 5a) + 5b)

## Oefening....
